PYTHON AND SQL DEVELOPER
EDINBURGH OR LONDON OFFICE

MUDANO
WASTE LESS. DO MORE.

Driven by data.
Navigated by humans.

Our mission is to harness project data to help people make the best decisions.

About Mudano

Mudano is developing the autonomous project.

We capture data on projects – such as daily tasks, meeting notes, team sentiment, resource information and project progress – and use it to guide better decision-making. Using machine learning we can predict the path of a project, helping teams to foresee issues, improve productivity and deliver efficiently.

We call this Delivery Science^{TM}

Be part of changing the industry

Our teams are focused on delivering projects in a data-driven, value-led manner.

Our entire business is focussed on using data to drive better decision making. From cutting edge AI research in our R&D team, to exciting uses of machine learning and data visualisation to solve our client problems, data is in the DNA of Mudano. That also applies to how we run our own business. This is a unique opportunity to work directly with the CEO and leadership team to help use data to drive critical business management decisions.

There will also be many personal growth opportunities to move into other parts of the business, such as software engineering, client facing consultancy work or R&D as your career develops.

This is a truly once in a career opportunity to be a part of driving business decisions for an extremely fast-growing scale up and seeing an immediate impact from your work. If you are passionate about data and engineering, interested in entrepreneurship and ready for an extreme personal development journey – there is no better role available anywhere.

Different works here

What Wll You Be Doing?

You will be combining information from a variety of sources to build up a suite of business leadership reports and KPIs. You will produce a series of dashboards and reports based on world class data visualisation techniques. You will need to update existing APIs written by our team to integrate online tools with the database and also write new APIs to integrate new tools. You will be working directly with exceptional data experts from across our business.

Desired Skills and Expereince

/ Intermediate-level SQL skills

/ Python experience to write API integrations and to encode simple algorithms

/ Minimum two years professional experience OR relevant technical university degree

/ Willing to learn Tableau (training can be provided)

Love what you do

Benefits and compensation

/ Salary 25k - 35k depending on skills, experience and qualifications

/ Flexible holiday plan of 25 days annual leave (plus bank holidays)

/ Comprehensive benefit package including private medical, wellbeing cover, discounted gym membership, and life insurance

/ Pension scheme with 3% employer contribution

/ Entry into our company stock option scheme

/ Individual training budget and career mentoring

/ 1% club – small benefits that make a big difference (i.e. monthly audible/book allowance, UBER for business)

/ Edgy head-office in start-up incubator (including Thursday beer hours, networking, TED style talks, and unlimited tea/coffee and fruit)

/ Choice of Mac, Windows, or Linux dual-boot and tablet

/ Flexible working
